S152	S152	CHARGER_PRSENT#	MANAGEMENT	I OD CMOS	1V8...5V	PU 10K	Held low by Carrier if DC input for battery charger is present	Standby/Sleep	
S153	S153	CARRIER_STBY#	MANAGEMENT	O CMOS	1V8		The Module shall drive this signal low when the system is in a standby power state.	Standby	
S154	S154	CARRIER_PWR_ON	MANAGEMENT	O CMOS	1V8		Carrier Board circuits (apart from power management and power path circuits) should not be powered up until the Module asserts the CARRIER_PWR_ON signal.	Standby	
S155	S155	FORCE_RECOV#	BOOT	I OD CMOS	1V8	PU 10K	Low on this pin allows nonprotected segments of Module boot device to be rewritten / restored from an external USB Host on Module USB0. The Module USB0 operates in Client Mode when in the Force Recovery function is invoked. Pulled high on the Module. For SOCs that do not implement a USB based Force Recovery functions, then a low on the Module FORCE_RECOV# pin may invoke the SOC native Force Recovery mode - such as over a Serial Port. For x86 systems this signal may be used to load BIOS defaults. Pulled up on Module. Driven by OD part on Carrier.	Standby	
S156	S156	BATLOW#	MANAGEMENT	I OD CMOS	1V8...5V	PU 10K	Battery low indication to Module. Carrier to float the line in inactive state.	Standby/Sleep	
S157	S157	TEST#	MANAGEMENT	I OD CMOS	1V8...5V	PU Vendor specific	Held Low by Carrier to Invoke Module Vendor Specific Test Functions	Standby/Sleep	
S158	S158	GND	PWR GND
